Pending evidence per user story (HU)

Paso Firme n8n automations · generated 2026-10-27 from `origin/dev`, `feat/20-demo-data-flow`, `feat/7-expired-reservations` (PR #41) and `feat/10-excel-migration` (local, not pushed). No test was run while writing this report.

Summary

HU / issue	Evidence in repo now	Still to save
HU-01 #1, flow 01	2 screenshots (confirmation, paid in full)	SMTP break → flow 08 alert (task 2.3 open)
HU-02 #2, flow 02	2 screenshots (partial receipt, last deposit)	Nothing required; optionally the no-email shop alert
HU-03 #3, flow 03	None; flow not built	Results table for the 9 emails in `docs/evidence/03-remote-deposits/`, receipts, no-duplicates, app-down alert
HU-04 #4, flow 05	Text-only `README.md`, no screenshots	Email and CSV screenshots, most real-n8n checks
HU-05 #5, flow 08	1 screenshot; README marks scenarios 1–5 "pending"	One screenshot per scenario, arrival time < 1 min, Madrid time
HU-06 #6, flow 06	None (no folder)	Reminder emails and `avisos.csv` screenshots
HU-07 #7, flow 06b	None; PR #41 open	Voucher email, shop summary, run checks
HU-09 #9, flow 04	None	Large-sale email; proof that the small sale sends nothing
HU-10 #10, flow 10	Text-only `README.md` with the output of runs on a throwaway stack (not the team's n8n); no screenshots	Run on the team's n8n with the real flows 01, 02 and 08: report email, app after the load, router ignoring events, second run, flow 08 alert
#20 demo data	12 screenshots, only on `feat/20`	Merge to `dev` (issue closed but not on `origin/dev`)
#21 final evidence	Nothing	Full lifecycle: create, deposits, settlement

HU-08 and HU-11 to HU-16 are not started (Medium, Advanced, Expert); no evidence needed yet.

> Issue #4 is closed, but its evidence README says it must not close until the remaining work is done. Reopen it or keep the checklist visible.

Common setup

- `docker compose -p paso-firme up -d` (never wipe volumes).
- Publish the router; flow 08 is the Error Workflow of every flow.
- Use your own email as the customer.
- Save PNGs in `docs/evidence/<NN-name>/`; crop out any secret.

Tests and steps per HU

HU-01 · Confirmation (flow 01)

Test: SMTP failure triggers the flow 08 alert (task 2.3).

1. In n8n, set a wrong password on the SMTP credential.
2. In the app (http://localhost:8000), create a reservation with your email.
3. Open Executions: flow 01 shows an error and the flow 08 alert reaches `TIENDA_EMAIL_AVISOS`.
4. Screenshot the failed execution and the alert email.
5. Restore the credential, create another reservation, check the confirmation arrives within 1 minute.

HU-02 · Receipt (flow 02)

Nothing mandatory. Optional re-check:

1. Register a partial deposit; screenshot the receipt.
2. Register the settling deposit; screenshot the "collect your shoes" email.

HU-03 · Remote deposits (flow 03, not built)

Test: the 9 sample emails in `data/correos/`.

1. Build the flow; check IMAP, the Groq credential, and `GET http://tienda:8000/api/apartados?estado=activo` from n8n.
2. Seed the demo data (flow 90) so names match.
3. Send each `.eml` to the monitored inbox. Expected: 01 and 09 register; 02 registers by number; 03 registers and settles; 04 asks Marisa (overpayment); 05 asks Marisa; 06 asks Marisa (past deadline); 07 asks Marisa; 08 ignored.
4. Screenshot each n8n execution and the resulting email or app deposit.
5. Write the results table in `docs/evidence/03-remote-deposits/README.md`.
6. Check customers get the flow 02 receipt for registered ones and flow 03 emails no customer.
7. **Idempotency:** run the same emails again; no new deposits in the app.
8. **Error branch:** `docker compose -p paso-firme stop tienda`, send a payment email, confirm the flow 08 alert, start `tienda` again.

HU-04 · Daily close (flow 05)

Follow `workflows/tests/05-daily-close.md`. Remaining checks:

1. **Totals vs app:** manual trigger for 3 dates, one empty; compare with `GET /api/ventas?desde=D&hasta=D` and the deposits.
2. **Email:** run with `send_email` on; screenshot the busy-day and empty-day summaries.
3. **CSV:** screenshot `basedatos.csv` opened with `;` as separator.
4. **Rerun:** same date after changing data: one row per date, same file ID.
5. **Row order:** new dates append at the end, existing ones update in place (task 3.6). Current code sorts ascending, so change the code first.
6. **ETag:** modify the file after listing; `If-Match` blocks the replacement, a rerun reads the latest file.
7. **Output isolation:** deny kDrive and confirm the email is still attempted; break SMTP and confirm the CSV is saved, then the execution fails.
8. **Flow 08:** stop `tienda` and run in a published state (manual runs do not fire the Error Trigger).
9. **Schedule:** with permission, set it a few minutes ahead, publish, confirm one run in Madrid time and the email; restore 23:55 and unpublish.
10. **New data counted:** create a reservation with a deposit and a sale, run the close, check both are counted.

HU-05 · Error alerts (flow 08)

1. Publish `99 Error Test` only for the test.
2. Run `node workflows/code/run-08-scenarios.js` (or post each scenario to the webhook).
3. Screenshot the alert for each scenario: (1) flow, step and message; (2) `Authorization: [oculto]`, secret absent; (3) `api_key` masked, `detalle` visible; (4) cut to 500 characters; (5) `error sin mensaje`.
4. Note send and arrival time (under 1 minute) and that the email shows Madrid time.
5. Replace "pending" in the README table with the screenshot names; unpublish `99`.

HU-06 · Due reminders (flow 06)

1. Create a reservation with your email and a deadline 7 days out (flow 90 or the app).
2. Manual trigger with `fecha` = deadline − 7; screenshot the email and the new `avisos.csv` row.
3. Run the same date again: no email, no new row.
4. Run with `fecha` = deadline − 1; screenshot the 1-day email and the second row.
5. Run for a reservation without email; screenshot the shop alert and the `sin_email` row.
6. Save in `docs/evidence/06-due-reminders/`.
7. Task 5.1: grep the exported JSON for credentials, `localhost`, real addresses, kDrive IDs.

HU-07 · Expired reservations (flow 06b, PR #41)

1. Build the flow and complete tasks 3.1–3.4.
2. Create a reservation with your email and a past deadline (flow 90, scenario 5).
3. Manual trigger: check the app shows `vencido`; screenshot the voucher email and shop summary.
4. Run again: no second voucher, no summary.
5. Run with a reservation without email; screenshot the "avisar a mano" entry with its voucher code.
6. Break SMTP for one run: reservation expired, flow 08 alerts, voucher code still reaches Marisa.
7. With permission, publish and confirm the 09:05 schedule fires once in Madrid time, then unpublish.
8. Save in `docs/evidence/06b-expired-reservations/`.

HU-09 · Large sale (flow 04)

1. Set `TIENDA_UMBRAL_VENTA_GRANDE=150` in `.env`.
2. Register a 100 € sale; screenshot the execution that ends without sending.
3. Register a 189,50 € sale; screenshot the one email.
4. Change the threshold, run `docker compose -p paso-firme up -d`, repeat; the result changes.
5. Save in `docs/evidence/04-large-sale-alert/`.

HU-10 · Excel migration (flow 10)

Already run on a throwaway stack on 2026-10-27 (text output in `docs/evidence/10-excel-migration/README.md`; cases in `workflows/tests/10-excel-migration.md`). Still to do on the team's n8n. Use a **clean copy of the app** (a second compose project or a fresh volume started with `SEED=0`): the app has no delete endpoint, so a load into `paso-firme` cannot be undone.

1. Create the Data Table `migration_state` (columns `clave`, `activa`, `desde`) with one row `migracion` / `false`. Import `workflows/10-excel-migration.json` and the new `workflows/00-event-router.json` (`scripts/import_new_workflows.py` does not replace an existing router: rename or archive the old one first, then relink the three *Call* … nodes).
2. Choose the shop Header Auth and SMTP credentials, set flow 08 as the Error Workflow of flow 10, publish the router and flow 10.
3. Open the form and upload `data/excel_actual_apartados.csv` and `data/excel_actual_ventas.csv`; screenshot the form and the report email. Expected subject: `Migración del Excel: 7 apartados, 3 abonos, 6 ventas · 2 para revisar` (Lucía Gómez's two rows held).
4. Screenshot the app afterwards: `GET /api/apartados/resumen` shows 7, plus 10 abonos and 6 ventas with their original dates.
5. Screenshot the router executions during the run: all succeeded, flows 01 and 02 did not run and no customer or shop email was sent; `migration_state.activa` is `false` about 15 seconds after the last create.
6. Run the form again with the same files: nothing is created; the report says 7 / 10 / 6 already loaded; screenshot the report and the unchanged counts.
7. Send a real `abono.registrado` afterwards (register an abono in the app): flow 02 sends its receipt as usual.
8. **Error branch:** put a wrong key in the shop credential and submit: the execution fails on the first read, flow 08 alerts, nothing is created and the flag stays `false`. Restore the key.
9. Save in `docs/evidence/10-excel-migration/`; crop out any secret.

#20 / #21 · Full lifecycle

1. Merge `feat/20-demo-data-flow` into `dev`.
2. On a clean app, run flow 90; check five reservations and screenshot them.
3. Record a short video of one reservation: creation, partial deposit, settlement, with router executions and each email (flows 01, 02).
4. Run flow 90 again; confirm nothing is duplicated.
5. Add `docs/evidence/README.md` indexing every folder; tick #21.
